PROJECT DETAIL

Enterprise Application Migration Stabilization Framework

Summary

Built from the successful remediation work in Case 1, this project turns validated fix logic into a structured framework for controlled deployment. Because packaging beyond the remediation stage was blocked by external factors, the current version stands at successful test-device instantiation, with full production completion still pending.

What We Found

- **Failure review:** Looked at endpoint failures from a large version migration
- **Main causes:** Found user-context drift, cache conflicts, shortcut issues, installer weak points, and validation gaps
- **Fix mapping:** Matched live remediation steps to new package controls
- **Change tracking:** Built a clear way to link each package change to a known problem and result

Results

- **Test-device result:** Resolved duplicate paths, intermittent launch failures, and workaround drift on the validation device
- **Installer flow:** Reduced installation ambiguity with earlier failure detection
- **Prepared output:** Assembled records for review, change submission, and later audit
- **Next step:** Production rollout remains pending

How It Helped

- **Technical teams:** Control mapping, smoke tests, integrity checks, and package comparisons for review and safer deployment decisions

- **Business and compliance:** Clear summaries, confidence statements, and before/after framing without heavy technical language
- **Change process:** Prepared project materials for controlled change review and submission
- **Future migrations:** Prepared a process that can be reused once rollout is completed

Why It Worked

- **Clear proof:** Each control stayed linked to installer behavior, remediation results, or endpoint state
- **Clear boundaries:** Confirmed findings were kept separate from assumptions and open questions
- **Shared access:** One structure worked for technical teams, compliance reviewers, operations, and documentation work
- **Reusable process:** The same approach can be used on future enterprise migrations with similar failure patterns

Attribution Note

This portfolio description was prepared with AI-assisted drafting support. Repository artifacts and technical documents were used to summarize the work while preserving confidentiality.
